Video: Part 1-3 – Electric Fields

Electric Fields

By definition, they are “LINES OF FORCE”

Some important facts:

- An electric field is a vector
- Always is in the direction that a POSITIVE “test” charge would move
- The amount of force PER “test” charge

If you placed a 2nd positive charge (test charge), near the positive charge shown above, it would move **AWAY**.

If you placed that same charge near the negative charge shown above it would move **TOWARDS**.

Electric Fields and Newton's Laws

$$F_g = G \frac{mM}{r^2}, F_e = k \frac{qQ}{r^2}$$

$$\frac{F_g}{m} = g, \quad \frac{F_e}{q} = E$$

Once again, the equation for **ELECTRIC FIELD** is symbolic of the equation for **WEIGHT** just like coulomb's law is symbolic of Newton's Law of Gravitation.

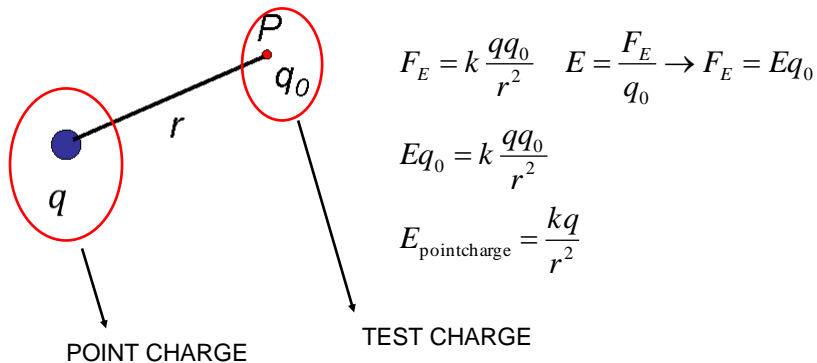

The symbol for Electric Field is, “E”. And since it is defined as a force per unit charge the unit is Newtons per Coulomb, N/C.

NOTE: the equations above will ONLY help you determine the MAGNITUDE of the field or force. Conceptual understanding will help you determine the direction.

The “q” in the equation is that of a “test charge”.

An Electric Point Charge

As we have discussed, all charges exert forces on other charges due to a field around them. Suppose we want to know how strong the field is at a specific point in space near this charge the calculate the effects this charge will have on other charges should they be placed at that point.

Electric Field of a Conductor

A few more things about electric fields, suppose you bring a conductor NEAR a charged object. The side closest to which ever charge will be INDUCED the opposite charge. However, the charge will ONLY exist on the surface. There will never be an electric field inside a conductor. Insulators, however, can store the charge inside.

Video: Part 4 & 5 – Dipole and Parallel Plates Electric Field Configurations

Example #1

When a 5 nC test charge is placed at a point, it experiences a force of 2×10^{-4} N in the x-direction.

- What is the electric field \vec{E} at that point?
 - What is the force on an electron placed at this point?
-

Example #2

An electron is projected into a uniform electric field with a strength of $E = 2000 \text{ N/C}$ with an initial velocity of $v_0 = 10^6 \text{ m/sec}$ perpendicular to the field. By how much is the electron deflected after it has traveled 1 cm?

Example #3

The Earth has an electric field of about 150 N/C pointed downward. A $1.00 \mu\text{m}$ radius water droplet is suspended in calm air. Find:

- the mass of the water droplet
 - the charge on the water droplet
 - the number of excess electrons on the droplet
-
